Left to clover.
As I understood, the bindle HD2500,HD4000 (capri) with amd one is not long for this world, and z77-ds3h have hd4000 chip. z77-ds3h for nvidia only, as I had undersand.
I can add id-platform-od (there is a 0x01620007 one), change 47465830 one to 49475055 (GFX0 to IGPU) and PEGP to GFX0 values (for my discrete one), but I can't have hardware accel for igpu.

Code

1. /Users/iron/Downloads/001/VDADecoderChecker\ 2 ; exit;
2. AVDCreateGPUAccelerator: Error loading GPU renderer
3. VDADecoderCreate failed. err: -12473 <<<<<<<<<<<
4. An error was returned by the decoder layer. This may happen for example because of bitstream/data errors during a decode operation. This error may also be returned from VDADecoderCreate when hardware decoder resources are available on the system but currently in use by another process.
5. VDADecoderCreate failed. err: -12473
6. logout
7. Saving session...
8. ...copying shared history...
9. ...saving history...truncating history files...
10. ...completed.

fcpx 10.4 will being to crash my system.
