Hello, sorry for replaying in english I prefer this way instead of google translate 🙂
Today I tried the same network card from Lenovo, it's detected correctly with the AppleEthernetIXGBE and it's seen as X540-AT2 but every-time I'm enabling the link the system is crashing. Did you guys tested on AMD CPU's? I'm running a Ryzen 5950x with Monterey 12.6 and the latest OpenCore.

Thanks!
