`Erledigt` HDMI-Probleme bei OZMOSIS 1479 und GA-Z87MX-D3H

Beitrag von „nikoZ" vom 19. Januar 2015, 10:53

I inspected latest flashed bios 5 days ago from OZ Database, and I saw it has no VoodooHDA. My spec also use after install only ALC892 AppleHDA, and Intel LAN.

I'll play with BIOS settings again to see what I can do.

EDIT: Problem partially solved. I set memory to 64MB, BIOS to Other OS UEFI only, and PCIe to Auto (it was Gen3, i think that was the reason I got KP).

Remains one minor problem: After I switch input from TV to (HDMI > TV) I get on PC monitor mouse stuttering.

SMBIOS i use it's iMac 15,1. I tried also with iMac 14,2 same problem.

Thanks.

EDIT2: It's mainly a Yosemite framebuffer issue because if I switch Display mirroring off after i switch TV input, mouse lag it's gone, till i switch again.
