Wie bekomme ich El Capitan auf meinem Rechner zum laufen?

Beitrag von „neoyoli“ vom 14. September 2015, 13:20

I have followed the guide step by step, have all the latest Clover and FakeSMC, however when I start the installation with Clover, the Screen goes black and nothing happens, I have to press reset. Any thoughts?

Okay, I managed to run the installer, using FakeSMC from the latest HWSensors, and installing Clover in USB EFI system partition (ESP) (previously I just used standard install). Put FakeSMC 6.18.1394 in 10.11 folder and configured [SIP](#) 0x67 in config.plist (actually it was like this by default).

However, I launch the USB installer from BIOS, and when the progress bar is at around 3/4, the install screen goes like this:

I also reflashed Ozmosis, and tried Clover OS X El Capitan USB tool as well, same happens. What do you think the problem could be? 😞
