Ozmosis 1749 Flashing Question [English]

Beitrag von „Sascha_77“ vom 14. September 2015, 10:27

You can use Ozmosis with El Capitan. But there are one step more to do as with Yosemite. You must install Clover to your El Capitan Installer and put the needed Kexts (FakeSMC for example) into /EFI/CLOVER/kexts/10.11. After Installation your **1st** boot to your new system you must use Clover from your Installer Partition (or USB-Stick) again. Install the extra Kexts in /S/L/E with KextWizzard on your new system. Before you do this you have to disable [SIP](#). You can do it this way in Terminal:

Code

```
1. sudo nvram 7C436110-AB2A-4BBB-A880-FE41995C9F82:csr-active-  
config=%67%00%00%00
```

Reboot, install the Kexts with the Wizzard, repair permissions, rebuild Kext-Cache. Than in Terminal activate [SIP](#) again

Code

```
1. sudo nvram 7C436110-AB2A-4BBB-A880-FE41995C9F82:csr-active-  
config=%00%00%00%00
```

and reboot.

Now you can use El Capitan with Ozmosis. I did it last weekend on my Hack. No Problems so far.
