Wie bekomme ich El Capitan auf meinem Rechner zum laufen?

Beitrag von „neoyoli“ vom 14. September 2015, 23:56

When I first Installed Mavericks with Chimera, I had an NVIDIA card (don't remember which, but the last one was GTX 760), then I flashed Ozmosis and I was still using it (under the same Mavericks), and some months ago I've sold it and switched to IGXF, this is why I deleted from my signature. Since then had I those rare random freezings.
