Der Kext gehört auch nicht in die ESP nach /EFI/OZ/ACPI sondern muss mit dem KextUtility installiert werden nach /S/L/E lediglich die DSDT gehört auf die ESP...

Just install AppleHDA.kext with KextUtility to /S/L/E and place the provided dsdt.aml into /EFI/OZ/ACPI/Load and you're good to go 😊

I had place dsdt.aml into /EFI/OZ/ACPI/Load/

Install AppleHDA.kext with KextUtility to /S/L/E and reboot.

no result. no audio.

Also my hd7970 video is working very strangely, when I flash bios with Z77DS3H_OZ_1669_M.F9. Before it I have Ozmosis_1479_F9, but 1479 not compatible with 10.11 OS. All transparency effects had disappeared on 10.10, and 10.11 OS X with Z77DS3H_OZ_1669_M.F9.

Code

1. sudo csrutil status
2. System Integrity Protection status: disabled.
3. sudo nvram -p | grep kext-dev-mode
4. boot-args kext-dev-mode=1 rootless=0

I can't speak German, but ozmosis subj had discuss >normally< only at German resources.

Z77-DS3H rev. 1.0, i7 3770k, amd hd7970.
