## **[English] GA-Z97-HD3 with HD4600 can not boot**

**Beitrag von „thadeth“ vom 17. Januar 2016, 21:19**

This time it gives me kernel panic and turns the screen off at the same moment. 😞

BTW if I put any supported nVidia VGA will I be able to install without problems ?

EDIT:

I managed to somehow install El Capitan on the same configuration. Now the only problem is that it shows HD 4600 with 5mb or 7mb memory in system>about this mac. Also the screen is flickering and I think QE/CI is disabled. In system profiler it says kext not loaded but it shows the vga with ID and everything normal. I tried with FakePCIID.kext and FakePCIID\_HD4600\_HD4400.kext but does not work.
