[@derHackfan](#) Sieht schon recht problematisch aus:

"How To Enable ATI Radeon HD 5670 on OS X Yosemite (Clover Bootloader)
Today I want to share how to enable most ATI Radeon graphic cards in OS X.

For the first step, you should check its dev id from your About This Mac.
HD 5670 comes with 68d8 dev id then let's check it in Extensions folder because the dev id must be in it. Open Finder and go to AMD5000Controller.kext in /System/Library/Extensions/. Right click on it then select show package contents and go to info.plist in Contents folder. The 1002 is code for vendor id, "ATI Radeon" in this case.

In different model of graphic card, you may add it manually, don't forget to backup this kext first. In older OS X it can be found at ATI5000Controller.kext. Do the same method for AMDRadeonX3000.kext or ATIRadeonX3000.kext on older kext.

The second step is edit the config.plist of Clover setting under your EFI partition. How to mount EFI partition? Just enable Debug mode the Disk Utility then check "Show Every Partition" and mount it.

Under <key>Graphics</key>, add "Baboon" in FB Name key. What's Baboon? It is one of ATI Radeon 5000 chipset name. While there are some chipset name like Douc, Langur, Uakari, Zonalis, Alouatta, Hoolock, Vervet, Eulemur, Galago, Colobus, Mangabey, Nomascus, Orangutan for ATI Radeon 5xxx. You should get your HD 5670 working eventhough I never get the DVI port works. I tried HDMI and the VGA port and they work together well."

Hab grad euer Sysinfo Tool ausprobiert. Leider zeigt er mir keinerlei Hardware dort in der Liste an. Will vorher eine Datei downloaden was nicht klappt. Eine Idee oder ist das Tool nicht so wichtig?
