## Osmosis für FileVault 2 ?

**Beitrag von „43n79w“ vom 2. März 2016, 00:55**

Sorry, I do not speak German but I am trying to understand this thread using Google Translate. I have a Gigabyte UP5-TH with latest Ozmosis. I enabled FileVault 2. But now ever time I boot I get to the FileVault user selection screen. At this point my mouse and keyboard stop working. The computer is still running because I get a message after a couple of minutes telling me to hold down the Power button if I'm having problems entering the password. Since my keyboard doesn't work, I can't enter my password at all, or even choose the user to login to the computer as.

I have tried using every single USB port and seemingly every combination of BIOS option related to USB. Nothing appears to get the keyboard to work at this unlock screen.

Would anybody be able to help? I am very new to Ozmosis and just flashed my BIOS with a version of 167X I found online.
