El Capitan 10.11.4 Problem mit Ozmosis?!

Beitrag von „crusher“ vom 8. April 2016, 11:34

Open terminal and write like this:

Code

1. diskutil list

and you have this results

you see my EFI partition is on disk1 maybe your on disk0.

Later write in terminal like this:

sudo diskutil mount disk1s1 or disk0s1 i dont know where is your EFI partition.

and you have mounted EFI partition

Ok now use this Defaults.plist(attached) and copy to EFI/OZ.

Restart PC go to bios and Reset NVRAM.

Good luck
