Skylake Sammelthread (Hilfe und Diskussionen)

Beitrag von „YogiBear“ vom 25. April 2016, 08:12

Hello and 😊 !

Basicly Ozmosis can handle SkyLake, but there is an problem aside from Ozmosis itself: AMI (the BIOS/UEFI vendor) uses a new revision of Aptio for SkyLake chipsets, so the tools used to create BIOS mods for IvyBridge and Haswell chipset don't work with SkyLake ones. Without an update of the tools boxes behind BIOS modding there will be corrupted non-working files - and we will not provide them for flashing because of the risk of damaging your board. There are ways to bypass this incompatibility but creating a single mod without tools like MMTools or OZMTool takes much longer while the resulting file maybe infunctionable... (Maybe [@crusher](#) knows more or could explain it better?)

You could use Clover as bootloader in the meantime - there are already several working builds on our board, see [Skylake Sammelthread \(lauffähige Konfigurationen\)](#) I assume there will be an Ozmosis-Mod in future but I don't know when they will be ready.

Best regards
Yogi
