

## **Erledigt** Filme iTunes

**Beitrag von „lhanke28“ vom 7. Juni 2016, 12:00**

From the shiki manual:

Azul GPUs (e.g. HD 4400, HD 4600) when used with a connector-full platform-id without a discrete GPU cause a system freeze due to not working HDCP playback. The issue is unrelated to Shiki, and happens regardless of iTunes and QuickTime.

--- end

What does it mean? If we not use the connector-full platform-id then it will work? What's to do? DSDT-corrections or/and modifications in the config.plist from clover or defaults.plist (when using ozmosis)? At this time more questions than answers.
