HP Z820 Workstation + Mac OS X Yosemite/El Capitan

Beitrag von „ibnahmed" vom 15. Juni 2016, 21:38

I have your DSDT times adjusted and packed in your Clover folder to the right place. Along with the custom DSDT the InjectUSBAll.kext should also be loaded and thus the installation of El Capitan from the USB stick be possible. [/ Quote]

hello griven, i have used your clover folder in this post. [HP Z820 Workstation + Mac OS X Yosemite / El Capitan](#) I was to install osx 10.11.4 and i have LAN working and therefore processor (but not with Turbo Boost). I have an issue wiht the memory though. The Z820 has two memoy boards with a total of 16 memory slots and this DSDT.aml sees only one memory board with 8 slots only. So, can you help me in Both issues

1- i need to see all 16 memory slots
2- i need turbo boost working. Currently clock speed is limited to 2600 for E5-2670 2.6GHZ. Can the vooodoooTSCsync.kext help?

Appreciate your help. I have Z820 with 2xe5-2670 and Quadro 5000.

i can upload my fresh dsdt.aml and SSDT.aml if required.
