Hi drdude,

Thanks for sharing your experience. I have played with the memory settings in the SMBIOS and now my computer sees the correct memory. Thanks. However, i could not get the audio to work. Not really an important topic for me.

However, my big concern is really the turbo boost. My hacki does not turbo boost. It just run at 2.57 GHz while turbo boost normally brings it up to 3.1GHz (in windows). This affects me a lot. I get geekbench of 30k only. with turbo boost i am sure i will be crossing the 35k mark. by the way, in geekbench scores i see one guy reaching 41k with these two processors. I really wonder how he/she does it.

I appreciate if someone can solve this for us.
