Erledigt **Enabling audio packs Sierra**

Beitrag von „al6042" vom 22. Juli 2016, 09:38

The AppleALC works as an AddOn to the original AppleHDA.
It contains the necessary patches for lot of AudioCodecs.

See the list in the following thread.
[AppleALC - der dynamische AppleHDA Patcher - immer aktuell](#)

There only the following things to consider and do, to make AppleALC work:

- If you don't use a DSDT to inject your devices, you have to use Clovers "FixHDA" in "Acpi"
- Also in Clover, you have to set the "Audio" -> "Inject" in "Devices"... In regards to the ALC887 with three backside outputs on your Board, I would suggest to use the number "3"... it this isn't working you can also try those numbers: 1, 2, 5, 7, 11, 12, 13 or 17...
- Last thing before you use AppleALC in your directory "/EFI/Clover/kexts/other", make sure there is no other Audio-related Kexts, other then the original AppleHDA and it Plugins running on your machine... check and delete the following kexts, if necessary: VoodooHDA, patched AppleHDA, cloverALC, realtekALC, HDAEnabler, HDADisabler.

Good Luck
