[giacomoleopardo](#): Hi there -

I have attached my config , driver64 and kext 10.11 (+ other) setup.

By now I am running the latest Clover version v2.3k r3676 - hope this is of some help to boot your system.

(Be aware my config uses the Mac6,1 profile with nVidia enabled - you need to remove the nvda_drv=1 from config.plist boot section in order to boot up your Install USB stick - otherwise you will end up with a black screen.)
