need help in installation el capitan on lenovo g 50

Beitrag von „OliverZ“ vom 27. September 2016, 20:37

In some models there is a bug in the BIOS of Lenovo notebooks. You should ensure that the boot sequence in the EFI-mode is the same as it is shown in the legacy-mode.

Don't forget to save the changes.

If you have an access to an original iMac or Macbook Pro you should use the app Diskmaker X to create an USB-stick with OS X El Capitan.

This action will last 15 to 20 minutes.

After that you have to install clover on the installer stick using the legacy mode.

After you have installed Clover on the installer for the legacy-mode on the installer-stick you should replace the complete files/directories in you EFI-directory on the EFI-Partition.

I highly recommend that you download the bootloader app Clover, Clover Configurator and EFI-Mounter from this forum. Diskmaker X can be downloaded from this forum too.

For a first installation of OS X it is very useful to install it on an external HDD/SSD if you have one. This means that you can work with your existing installation of Windows and you can test OS X on the external HDD/SSD until everything works.

The terminal command: `diskutil list` show you the different drives.

Replace the following files in your EFI-directory on the EFI-Partition with the attached ones:

- replace your config.plist
- in the CLOVER/Kexts directory put in the other.zip and unzip it. No other kexts should be in subdirectories like 10.10. or 10.11.
- copy the patches to the Clover/ACPI/patched directory and unzip it.

The only thing you have to do after the installation of OS X to patch the Apple HDA and configure the notebook for LAN.

Good luck and kind regards to Israel.
