Please make sure you use this [Mod Für das Z87X-UD5H Rev.1.x](#) rom file since it defines the system as an Nvidia friendly iMac14,1 and adds support for Audio with AppleALC.kext. Once you flashed the Rom enter your Bios Setup Utility and adjust all needed settings and save them. Enter the Setup Utility once again and perform an PRAM Reset (press and hold win+alt+p+r until screen turns red, orange, green) to make sure OZ initializes itself correctly. Once done boot into OS-X and mount your hidden EFI Partition. To do so open up a terminal and type

Code

1. diskutil list

in this commands output look out for a partition which is called EFI and write down it's identifier (e.g. disk0s1). Once you found the correct identifier go ahead and type

Code

1. diskutil mount diskXsY

where X and Y has to be replaced by your actual values. If everything went right you should see you EFI Partition appear on the Desktop or Finder. Now download AppleALC-OZM.kext.zip from [AppleALC - der dynamische AppleHDA Patcher - immer aktuell](#) and place it on the EFI partition in the folder /Efi/Oz/Darwin/Extensions/Common/ . Reboot with your NVIDIA Card in place and all should work as expected.
