## **Probleme mit OZM-Tool**

**Beitrag von „jboeren“ vom 26. November 2016, 16:13**

Hast du schon einen bios restore versucht? Unser board hat ja ein normales bios und ein backup bios...

### Method #1

1. Shut your PC down (if you're reading this guide, than your PC isn't working anyways)
2. Hold the power button until the PC starts and shuts down again
3. Press the power button again, your backup BIOS should kick in now and should re-flash the main BIOS if there's anything wrong with it.

### Method #2

1. Shut your PC down
2. Hold the power AND the reset button for about 10 sec, than release.
3. Backup BIOS should kick in anytime soon now.

Method #2 hat hier damals funktioniert!
