

Anleitung: USB 3.0 Mojave / (High-) Sierra / El Capitan für jedermann (zukunftsicher für Updates & komplett gepatcht)

Beitrag von „poof“ vom 13. Dezember 2016, 16:36

Google's translation from German to English isn't that good and my German isn't that good either, but put them together and I was able to understand everything you wrote 😊

I'm currently trying to make some changes to my DSDT (and probably the SaSSDT...?) to rename GFX0 > IGPU and PEGP (or PEG0...) > GFX0. I can't find info about how adding a DSDT.aml to EFI/OZ/APCI/Load will change things and if I'm able to disable it when something goes wrong. Can I overwrite a SSDT or do I need to drop them all? how would I go about that?

I posted what I'm trying to change in my DSDT and why on a different forum, help on this or how it all works with ozmosis would be very much appreciated.
