Erledigt **Difficulties following installation on modbios ozmosis Z77-D3H**

Beitrag von „griven" vom 20. Januar 2017, 23:21

Here you go 😄

I Just modified the stock Mod ROM to fit your needs so most of the problems should be solved with it. What I did:

- Changed built in defaults from iMac15.1 to iMac14.1 which fits perfectly to your NVIDIA
- Applied DSDT Patches to make USB, Sound, Sleep and shootdown work as expected
- Fixed SMBUS and LPC Device in DSDT as well

Just flash and place attached appleALC.kext into /Efi/Oz/Darwin/Extensions/Common/ an everything should work like a charm.
