

# macOS Sierra 10.12.4 Beta 1 - ACHTUNG BEI DER INSTALLATION

Beitrag von „nikoZ“ vom 26. Januar 2017, 11:36

I have not encountered any problems with ozmosis injection after 10.12.4 update. I'm running oz167x sierra patched with its original fakeSMC inside the BIOS.

But, I have to say my [SIP](#) its completely disabled.

I have GTX 560Ti Which works in Ozmosis without WebDrv by Ozmosis itself injection (DisableNvidialInjection) <false>
