AMD RX 490 und RX 480

Beitrag von „Brumbaer" vom 4. Februar 2017, 10:34

The Info.plist in the AMDRaeonX4000 kext is not complete. There are entries missing.

I do not have 10.12.4 installed, so I can't say this whether this is caused by the script or by using 10.12.4.

As I said before the X4000 ist the wrong kext to use anyway.

There is a 1.0.0 version on his website which uses the AMDRaeonX4100 kext - which would be the correct kext for 10.12.3 - I don't know about 10.12.4.

So make a backup of the AMDRaeonX4100 kext and try the new eGPU skript.
