Bootmanager Osmosis Problem!

Beitrag von „griven“ vom 5. Februar 2017, 22:46

In most OZ roms NVDIInjection is disabled by default since it causes massive problems with Nvidia Cards which need the Webdrivers (mostly Maxwell generation) to work anyway your card might need this feature to be enabled. Try to boot up in save mode (hold shift key after the PC is powered on) and if you hopefully reach the desktop fire up Terminal and type:

Code

1. `sudo nvram 1F8E0C02-58A9-4E34-AE22-2B63745FA101:DisableNvidiaInjection=%00`

Enter your password and reboot you should be good to go.
