Gigabyte Z77N-Wifi mit Ozmosis - HDMI-Audio wie zum Laufen bekommen?

Beitrag von „kramer2k“ vom 14. Februar 2017, 21:49

I know it's just cosmetic, but here is an updated DSDT based off of al6042 DSDT above with all built-in devices listed correctly under PCI in System Information and HDMI Audio. I currently have AppleALC_Ozm 1.0.19 loading from EFI partition working beautifully under 10.11.6.

If you add a PCI-e card, you can change the name showing up in System Profiler by editing "Display Controller" under GFX0. I changed mine to say "ASMedia 1061 SATA Controller"
