Post your efi and we Look what the Problem is !

Thanks DaTec! I attached it below. I also uploaded a screenshot of the error(s) I run into. It looks like I'm having a "Couldnt' alloc class "AppleALC" error, an "Unsynchronized TSC for CPU" error, and " RTC: Only Single RAM bank (128 bytes) " error which causes it to reboot

I am using [@Brumbaer](#) patch ported to macOS Sierra and I also edited my VoodooTSCSync.kext's IOCPUNumber to 19 (to match the 6950x).

Bios settings: AMI Version 1.3 (latest), XHCI Hand-off [Enabled], EHCI Hand-off [Enabled], Legacy USB Support [Enabled], XMP [OFF], MSI Fast Boot [Disabled], Fast Boot [Disabled], Intel VT-D Tech [Disabled], CFG Lock [Disabled]

Let me know what you think or if you need me to post anything else. Thank you so much again!!!
