Try addition bootflags:
npci=0x2000 or npci=0x3000

Hi [@ralf.](#), thanks for your suggestion! All the configs I use have to have npci=0x3000 otherwise there will be a memory allocation error so I have had that always :(. Thank you for your help! Let me know if you think there is anything else I should try.

What hardware have you installed?

i see your Configuration and Hardware. You can test this EFI

The exact hardware I have is: Corsair AX860i PSU, MSI X99A Gaming Pro Carbon, Intel Core i7 6950x, 1 x 16GB Corsair Dominator Platinum Series DDR4 DRAM 3200MHz C1, Samsung 950 512GB PCIe NVMe, and a NZXT IU01 Internal USB 2.0 Expansion Hub

[@DaTec](#), I also ran the EFI you attached; I'm attaching the screenshot below. It looks like there was some sort of an NVMe error and a kernal panic? I'm not totally sure as I haven't seen this before. Let me know what you think I should try next:) . Thanks again for all your help!
