## X99 - 6850K - El Capitan / Sierra | Absturz bei hoher Last (SOLVED!)

Beitrag von „sirbrem“ vom 26. April 2017, 17:58

Hi [@Robin0815](#),

My German is awful, but it sounds like you are working on a build very similar to mine. How is it coming along? Did you get everything working?

My setup is the following:

GIGABYTE X99-Phoenix SLI mobo  
i7-6850K  
64 GB DDR4-2400  
NVIDIA Geforce GTX 1080 Ti

Please forgive the noob questions. I'm new to the Hackintosh world. Your (and [@sygey](#)) configuration is the closest I've seen to my own. How are you finding all these kernel and kext patches? Also, how are these patches created? They seem like they are finding and replacing random numbers, but obviously they're coming from somewhere.

I'm trying to install macOS 10.12.4 Sierra and it stops after several lines that say:

```
"localhost com.apple.xpc.launchd[1] <Error>: assertion failed: 16E195: launchd + xxxxx [...] 0x9"
```

In addition to several other launchd errors and then ten or so sound assertion in AppleHDADriver errors, it finally gives up saying "Service exited with abnormal code".
