Need Help for Ozmosis Z97X-UD3H-BK rev1.2 F8

Beitrag von „griven“ vom 19. Mai 2017, 00:18

Well if using a GT640 you might need to enable NVIDIAInjection as well. Since it causes a lot of trouble with newer NVIDIA Cards (Maxwell and above) it's deactivated by default in our Sierra Ready OZ flavored Roms. To enable it just install OS-X by using the IGPU and once installed type fire up Terminal and type

Code

1. `sudo nvram 1F8E0C02-58A9-4E34-AE22-2B63745FA101:DisableNvidialInjection=%00`

or if available in your rom boot into build in EFI Shell and type

Code

1. `setvar -guid 1F8E0C02-58A9-4E34-AE22-2B63745FA101 DisableNvidialInjection=00`

which will do the same but without the need to install OS-X first.
