Sometimes it's kind of wired to understand which files OZ uses and which not...

Normally it should use the files placed on the EFI Partition of the first drive (first SATA Port) but it seems like it not always behaves that way. I have three internal drives which all have an EFI partition and the OZ files are present on all of them. Sometimes it seems to be absolutely random which files OZ grabs also the drive order randomly changes from boot to boot. In 95 percent of all boots my primary drive (first SATA Port) is disk0 and everything is fine but sometimes one of the other drives is mapped as disk0 and in these rare cases the boot might fail or drivers may be missing because the EFI Partitions across all three drives are not in sync. To prevent situations like this I got used to keep all my EFI Partitions in sync so it doesn't matter at all where OZ grabs its files from.

Nevertheless it would be nice to know why this is happening even though the physical location of the drives never changed...
