Cannot get ALC1150 audio with Ozmosis

Beitrag von „griven“ vom 8. Juni 2017, 22:14

Well this rom does not contain any kind of VoodooHDA stuff since it caused trouble to some users so you're good to go 😄

To make Audio work four components are needed:

1. an untouched AppleHDA in /System/Library/Extensions
2. no HDADisablers oder VoodooHDA.kext anywhere in the System
3. Lilu.kext ([Lilu - Generic kext patcher \(neue Grundlage für AppleALC 1.1.x und Shiki 2.x.x\)](#)) and AppleALC_OZM.kext ([AppleALC - der dynamische AppleHDA Patcher - immer aktuell](#)) both placed on your hidden EFI Partition into /Efi/Oz/Darwin/Extensions/Common/
4. a patched DSDT which injects AudioID1 -> [DSDT.aml](#) placed on your hidden EFI Partition into /Efi/Oz/Acpi/Load/

Once done reboot and enjoy sound 😄
