M.2 WLAN/Bluetooth-Modul Hardware anfrage

Beitrag von „jemue“ vom 9. Juli 2017, 17:23

Hab gerade bei Tony im Forum einen Link zu eBay entdeckt:

<http://www.ebay.com/itm/391512537270>

Angeblich funktioniert das Teil

Zitat

I gave it a shot being that I've just purchased a Z270 ITX board and needed the x16 slot for my GPU. Well coupled with the Early 2015 MacBook Air BCM94360CS2 it works exactly like a real Mac. No extra drivers, no patches, no wires to usb headers, full AC WiFi, full handoff, airdrop, unlock and hotspot support! AND I can use my trackpad (I use a custom mechanical keyboard - Geekhack for life!) in BIOS and Clover! It uses the MacBook Air WiFi chip which is smaller than the Apple Broadcom Bcm94360cd that we're used to seeing on the older PCIe adapters. Sorry for the wordiness, I just get excited about this stuff! I hate when my Hack doesn't work like it should and in the specific WiFi/BT area of Hackintoshing, it's simple, nothing beats the real thing.

Zitat

[...] and USB works directly off the M.2 slot. It gets rid of the annoying cable to usb-header spec needed with the PCIe adapter.

Zitat

This particular adapter only works with Apple's BCM94360CS2. It gets kinda confusing because from what I understand there are TWO versions of BCM94360CS2... A pre-2012 and then a 2013-2015. You want the 2013-2015 obviously, as it has AC and BT 4.0. You want to search for "A1466 BCM94360CS2".
