APFS and High Sierra Support

CCC 4 will be qualified on macOS High Sierra with some support for APFS source volumes, but the majority of our APFS compatibility support is going into CCC 5. CCC 5 currently offers bootable system backups from APFS to APFS, HFS to APFS, and APFS to HFS, and of course HFS to HFS. Additionally, CCC 5 supports APFS encryption for both source and destination APFS volumes, as well as for remote Mac source and destination volumes. You read that correctly - CCC 5 can automatically unlock and mount your APFS-encrypted volumes on a remote Macintosh, and do so while maintaining the security of your encryption key in a keychain.

Das werde ich demnächst mal testen...
