

# [Sammelthread] Die besten Terminal-Befehle

Beitrag von „b33st“ vom 4. September 2017, 16:51

Ich habe nichts von der Reihenfolge geschrieben. Und ich hatte schon öfters, dass meine primäre Platte als z.B. disk4 und nicht als disk0 gemountet wurde. Deswegen auch im Beispiel die fett unterstrichenen Zahlen. Man sollte also wissen oder darauf achten, welche Platte man mounten möchte. Efi war in dem Fall weit verbreitetes Beispiel. Man möchte vlt. nicht immer die [Efi mounten](#) 😊

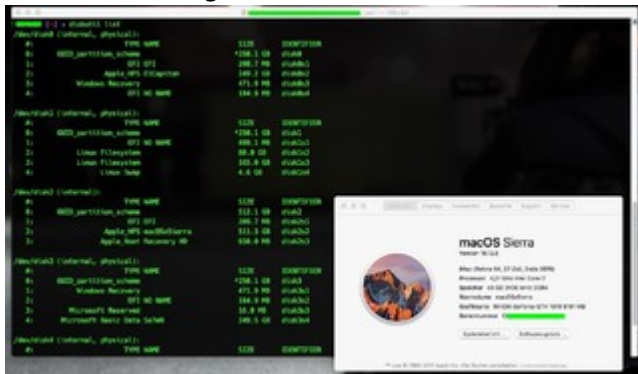

Das Weglassen vom führenden /dev - ja, kann man weglassen. Ich bevorzuge die absolute Pfadangabe.

edit:

Hier in meinem Fall habe ich viele Efi Partitionen rumliegen, nur die Zahl bzw. Part. Nummer ist entscheidend.

Welches System primär genutzt wird bzw. unter disk0 gemountet wird, ist zweitrangig. Habe zumindest ich die Erfahrung gemacht.

Hier, nach dem Neustart, hat sich El Capitan mit Linux "davor gedrängt", obwohl ich unter Sierra unterwegs bin 😊

The screenshot shows a terminal window with the command `diskutil info /dev/disk0` and its output. The output lists several partitions with their sizes and mount points. The first partition is highlighted with bold text. To the right, a macOS Sierra installer window is visible, showing the progress of the installation.

```
diskutil info /dev/disk0
#1:   TYPE:       EFI
#1:   MOUNT_POINT: /dev/disk0s1
