ATI R9 390X Dual Monitor

Beitrag von „derHackfan“ vom 13. September 2017, 15:21

Hast du es mal mit dem [Boot Flag \(-raddvi\)](#) versucht?

- Fixes transmitter/encoder in autodetected connectors for multimonitor support

Und weiteres zum [Framebuffer](#) hier?

- When should I use a named framebuffer? Named framebuffers (Baladi, Futomaki, Lotus, etc.), enabled by "Clover GPU injection" or any other methods should never ever be used. This way of GPU injection is a common mistake, preventing automatic configuration of various important GPU parameters. This will inevitably lead to borked GPU functioning in quite a number of cases.
