Crusher i flashed that bios then booted it it shows files loading etc... but hangs almost immediately on install im using a gtx 980 and i54670k any help would be appreciated thank you very much

Try to use `nv_disable=1` for your GTX980 and later install WebDriver. After install WebDriver you add `nvda_drv=1`. But do not forget you must reset NVRAM after change boot-args in Defaults.plist.
