@Puppy I am not sure how to solve your issue. HighSierra adds support for third party NVME SSD so it should work right out of the box no need to patch anything. Sierra needs a forced load of IONVMEFamily and a bunch of Kext2Patch entry to make it work but this is all useless in your case. As I mentioned before it seems like OZ loads prior to the NVME Driver which means at the time OZ scans the drives to build the boot entries for each bootable partition your NVME Drive is invisible for OZ. Please upload your modified rom and let me take a look at it.
