Hum seems like NVRAM is not writeable at all. The first Installer stage adds a NVRAM entry before it restarts the machine this entry is used to initiate the second stage. I am pretty sure that your NVME isn't the problem at all and the same will happen if you use a SATA SSD which is APFS formatted. Let's try something different since the earlier ROM versions often support writeable NVRAM here is a modded F7 Version (initial Release the Board was shipped with): [Z77PD3_HighSierra.F7.zip](#) please give it a try and let me know if it works for you or not.
