# High Sierra 10.13 - Installations Problem(e) ; Gigabyte X299 UD4 - i7-7800X - GeForce® GTX™ 1080 Ti

Beitrag von „drnoodle“ vom 18. Oktober 2017, 17:26

Welchen Webtreiber für die 1080 hast du genommen? Ton ist übrigens der Realtek ALC1220 Codec, ich suche mal nach einem Kext 😊

## Das hab ich gefunden:

Open config.plist using Clover Configurator

Click Devices on the left column

Check ResetHDA

Above Inject you will type in the audio ID number based on what audio codec your motherboard is using you will need to experiment with different numbers if the one is bold doesn't work for you. For a complete list of supported codecs see AppleALC Supported Codecs

ALC1220, Inject = 11 , 1 , 2 , 5 , 7

S1220A, Inject = 7 , 1 , 2 , 5

ALC1150, Inject = 1 , 2 , 3 , 5 , 7 , 11

ALC892, Inject = 1 , 2 , 3 , (4 for laptop) , 5 , 7 , 28 , 92 , 99

ALC887, Inject = 7 , 1 , 2 , 3 , 5 , 11 , 13 , 17 , 18 , 33 , 99

Save and close your config.plist file

Restart your Hackintosh
