## **Updating from Yosemite - Computer frozen**

**Beitrag von „fborensz“ vom 12. November 2017, 19:35**

You're right, I had a really simple installation : flashed BIOS with Ozmosis Mod and installed Yosemite from my USB Key. And installing the ethernet and sound (ACL1150) kexts. That's it.

I downloaded Clover Configurator (which I never used before), and mounted the EFI. But I don't have Oz in it. Only EFI>Apple. Do I have to create the OZ folder myself or did I do something wrong ?

By the way, you linked me to 1479m but I have the Sierra\_F9 mod. Is your link still good for my case ?

Thanks !!
