activation of the audio in High Sierra 10.13

Beitrag von „al6042“ vom 29. November 2017, 19:47

Hi [@exquyre](#) and Welcome to the forum... 😊

The issue with the Maximus VIII Ranger is the missing details in regards to the used audio codec.

On the specs website you can just read "ROG SupremeFX 2015 8-Channel High Definition Audio CODEC", which can be literally anything.

Try to create a Linux-Live-USB-Stick or -CD and use the following Terminal-Commands to see which codec will be found on the machine.

Code

1. `cat /proc/asound/card0/codec#0 > ~/Desktop/codec00_dump.txt`
2. `cat /proc/asound/card0/codec#1 > ~/Desktop/codec01_dump.txt`
3. `cat /proc/asound/card1/codec#0 > ~/Desktop/codec10_dump.txt`
4. `cat /proc/asound/card1/codec#1 > ~/Desktop/codec11_dump.txt`

This will create four text files on the Linux desktop in which one of those should be the name of the audio codec.

Check those files and upload the one with contents as an attachment using the "Advanced Reply"-function while replying...
