activation of the audio in High Sierra 10.13

Beitrag von „al6042“ vom 30. November 2017, 07:47

In that case it should be easy and as the same procedure as I explained on October 1st to Fram8579.

The usage of this methods rely on a couple of very important things:

- Make sure that the AppleHDA.kext in /System/Library/Extensions is the untouched/original version from Apple (no tempering with the kext via some of those scripts out there)
- Make sure you've got rid of all the other Audio-enabling kexts, like VoodooHDA, HDAEnabler, realtekALC, CloverAudio, ...
- Make sure you've disabled or deleted all AppleHDA-related "KextsToPatch"-entries in your config.plist for Clover...

BTW:

Please add your Hardware details in either your signature or your profile, within the section "About me", so everybody who wants to help, knows which components you're using...
