## **Shutdown Problem Sierra**

**Beitrag von „griven“ vom 10. Dezember 2017, 01:03**

Depending on the windows Version windows will not shut down completely (I guess this feature was introduced with win 8). Shut down Windows in this case means enter extended hibernate Mode (hibernate to disk) to speed up next boot and unfortunately it will not disconnect drivers correctly which leads to Problems if an other OS should start meanwhile since the Device ist locked to the hibernated Windows driver. To come across this issue you may configure Windows to shut down completely instead of using hibernate stuff for one time usage simply press and hold the shift key while you choose "shut down".
