## Shutdown Problem Sierra

Beitrag von „kocko“ vom 10. Dezember 2017, 18:27

griven, thank you for the answer.

Windows Hibernation is not turned on. In Windows PC, after turning off, it will remain off. The PC is turned on only in MAC.

FixShutdown does not help. In BIOS, USB-enabled is turned off. When I work on MAC and I want to shut it down, I restart the PC and shut down the PC in Windows.

I have something wrong set up in Config.plist ??? 😞
