Sleep->Wake = Crash bzw. Reboot

Beitrag von „kuckkuck“ vom 12. Dezember 2017, 13:34

Schau dir dazu mal die Kext HibernationFixUp in Kombination mit Lilu an.

Zitat

By design the mach kernel encrypts hibernate sleepimage and writes the encryption key to variable

"IOHibernateRTCVariables" in the system registry (PMRootDomain).

Anyhow this value has to be written into SMC, in order the boot.efi could read it.

Fortunately, boot.efi can read key "IOHibernateRTCVariables" from NVRAM!

This kext detects entering into "hibernate" power state, reads variable IOHibernateRTCVariables from the system registry and writes it to NVRAM.
