Sorry for the late reply. Been busy working... Here is my latest. EFI... No need for post-install anymore. All latest kexts and should also make the Touchpad work during install (no multi touch). This is however the state I use for macOS Sierra (10.12.6)

As for the WiFi I stay with the USB dongle even if it might mess with the hibernate mode. Regular boot and storing of windows works fast and is fine for me. So far I haven't seen anyone make it work with the M2 PCIe slot. If you find something pleas post here, too.
