May you need a "CPU-Power-Management"-Profile for your CPU-Type.

There is a script from Piker Alpha (ssdtPRGen script). This Profile has information for the CPU-Power-Management to increase the Multicore-Performance.

Without Profile my Xeon E5-1650v4 (6core with 3.6GHz) has only Macbook Pro 2017 4-Core-CPU Performance. The "CPU-Power-Management"-Profile increases to max. 6-Core-CPU-Performance (ca. 1095 CPU-Cinebench Tests approximately Windows Performance)
