### [BIOS settings](#)

Recommended is BIOS v1.46 (and stay on 1.46 if you want use a modded bios - but there are v1.48 and v1.49 mods now)

Recommended: reset to defaults. Most defaults settings will work - but check these settings:

Set Config / Serial ATA (SATA) / SATA = AHCI

Set Security / Memory Protection / Execution Prevention = Enabled

Disable Discrete Nvidia/Optimus (use integrated HD 3000 only - unless you really know what you are doing!)

Note: The custom DSDT is based off BIOS v1.46 (flashed with whitelist mod or original)
