`Erledigt` 10.13 gtx 1050ti and ga z97hd3 problem.

Beitrag von „firefly_can_fly" vom 23. April 2018, 20:54

Good day,

I've encountered a problem with oz and z97hd3.

While I mod bios with oz (or using one from forum) it working like it should be, until I install msi gtx 1050ti. After bios flash process, after first boot, the motherboard just freez. Nothing helping except power btn reboot.

My current rig:

Xeon e3 1245 v3

Z97hd3 (v2)

Msi gtx 1050ti

This rig works with windows 10 without a problem, clover - so far so good, but any kind of oz-nope.

Before what I did:

Tried update cpu micro codes with bios.

Update graphics card GOP drv

Contacting gigabyte support, they suggested that this is a socket problem. While people from service were inspecting socket screwdriver fall into the socket, so they repaired couple bend pins. Rig still working with windows 10 without a problem.

So now I'm out of options, ready to buy new motherboard.

The reason I'm asking about this, is only about that I want to know, this is hardware problem, or some parts are not supported? Maybe someone encounter similar problems, or this is z97 chipset problem. Tomorrow I will meet the guy with z97x-ud3h, so before purchase it, I would like to know, will it work.

Thank you!
